PREFACE AND ACKNOWLEDGMENTS

This report presents data from the Annual Housing Survey, which was sponsored by the U.S. Department of Housing and Urban Development and conducted by the U.S. Bureau of the Census. It was developed under the direction of Arnold H. Diamond, Director, Office of Economic Analysis, Department of Housing and Urban Development; and Arthur F. Young, Chief, Housing Division, Bureau of the Census.

Arnold H. Diamond, Duane McGough, and David Yentis were responsible for overseeing the Annual Housing Survey and the resultant report on behalf of the Department of Housing and Urban Development.

Within the Bureau of the Census, this report was developed in the Housing Division under the overall direction of Arthur F. Young, Chief. It was prepared under the supervision of Elmo E. Beach, Chief, Current Surveys Branch, assisted by Aneda E. France and George Spraggins. Specific activities related to data collection procedures, statistical presentation, organization of the report, and preparation of text materials were performed by Joyce A. Aso, Robert W. Bonnette, Mary C. Carroll, Paul P. Harple, Jr., Richard G. Kreinsen, Jane S. Maynard, Edward D. Montfort, Marjorie Shelton, and Janet A. Tippet. Important contributions were made by Aaron Josowitz, Nathan Krevor, Leonard J.

Norry, and Herbert Shapiro in the planning and coordination of the survey.

The operational aspects of the Annual Housing Survey were coordinated by the Demographic Surveys Division under the direction of Earle J. Gerson, Chief, by Stanley Greene, Assistant Division Chief, and Edward F. Knowles, assisted by John C. Cannon and Patricia A. McDermott. Systems and processing procedures were performed under the direction of Barry M. Cohen, Assistant Division Chief, by D. Richard Bartlett, Leonard Goldberg, David B. Lipscomb, and Robert G. Munsey.

The planning of sample design, weighting, and computation of sampling variances were developed in the Statistical Methods Division under the supervision of Morton Boisen, Chief, and Robert H. Hanson, Assistant Division Chief, assisted by David Bateman, Peter Bounpane, and Dennis Schwanz. Implementation of the sampling selection, computation of variances, and preparation of field sample control procedures were carried out under the supervision of Herman H. Fasteau, Assistant Division Chief, by Jude Klein, Tom Scopp, William Alsbrooks, Irene Montie, Fay Nash, and Patricia Clark (Data Preparation Division, Jeffersonville).

Data collection activities were administered by the Field Division under the supervision of Richard C. Burt, Chief, by

Stanley D. Matchett, Assistant Division Chief, Dean C. Schroeder, and William F. Hill, as well as the directors of the Bureau's regional offices.

Clerical processing of the questionnaires was performed in the Data Preparation Division under the direction of Hobert A. Yerkey, Chief, by O. Bryant Benton, Assistant Division Chief, Don L. Adams, and Harry Myers.

Within the Publications Services Division, many individuals made significant contributions in the areas of publication planning and design, editorial review, composition, and printing procurement.

GENERAL

This report presents detailed cross-tabulations on the housing characteristics of units occupied by "recent movers" from the 1973 Annual Housing Survey. Statistics are presented for the United States by inside and outside standard metropolitan statistical areas (SMSA's) and each of the four geographic regions. Households that moved into their units during the 12 months prior to enumeration are classified as recent movers. Characteristics of the present units of recent movers are cross-tabulated by characteristics of the previous units.

The Annual Housing Survey was designed to provide a current series of information on the size and composition of the housing inventory, the characteristics of its occupants, the changes in the inventory resulting from new construction and from losses, indicators of housing and neighborhood quality, and the characteristics of recent movers. The survey, performed for the Department of Housing and Urban Development, is authorized under sections 501 and 502(d), 502(e), and 502(f) of the Housing and Urban Development Act of 1970, Title 12, United States Code 1701z-1 and 1701z-2. The Bureau of the Census is authorized under Title 31, United States Code 686, to perform special work or services for Federal agencies.

The statistics presented in this report are based on information from a sample of housing units. The information for the survey was collected by personal interview from August 1973 to December 1973, with the bulk of the enumeration completed by the end of October.

This report series consists of four parts (see list on page III) issued jointly by the Department of Housing and Urban Development and the Bureau of the Census. Part A provides data on general housing characteristics, Part B on indicators of housing and neighborhood quality, Part C on financial characteristics, and Part D on recent mover households.

The content and procedures of the Annual Housing Survey were determined after consultation with a variety of users of housing data and through field pretesting. A large portion of the

subjects covered in this report is the same as those collected in the 1970 Census of Housing; in general these data are comparable to those shown in the 1970 census reports. In addition, a number of new items were introduced in this survey on subjects such as parking facilities, garbage and trash collection, breakdowns or failures in equipment, the physical condition of the structure, and neighborhood conditions and services. A few of these items are presented in this report.

More detailed information on the technical and procedural matters covered in the text of this report can be obtained by writing to the Director, Bureau of the Census, Washington, D.C. 20233.

Organization of the text.—The text consists of this introduction, a summary of findings including text tables, and appendixes A and B, which appear after the data tables. Appendix A describes the geographic area classifications and provides definitions and explanations of the subjects covered in this report. Appendix B presents information on sample design, estimation, and accuracy of the data.

Content of the tables.—A series of standard tables presents cross-tabulations of the data for occupied housing units for each area shown in this report. The numbers presented in these tables are rounded to the nearest thousand. Table 1 presents characteristics of all occupied housing units and units occupied by recent movers (households that moved into their units during the 12 months prior to enumeration). Tables 2 to 9 present characteristics of the present unit for recent mover households cross-tabulated by characteristics of the previous unit. The same subject content as shown in tables 1 to 9 is presented for housing units with Negro head of household in tables 10 to 18 and for housing units with household head of Spanish origin in tables 19 to 27.

INTRODUCTION—Continued

The prefix letter "A" has been assigned to the tables for the United States as a whole, "B" to the Northeast region, "C" to the North Central region, "D" to the South region, and "E" to the West region.

Sample size.—The statistics presented in this report are based on a sample of housing units and are, therefore, subject to sampling variability. The designated sample consisted of approximately 60,000 housing units located throughout the United States. The sample was selected from units enumerated in the 1970 census and updated to include units constructed since 1970. Detailed information on the sample design, size of sample, estimation procedure, and sampling variability associated with these data is given in appendix B.

Derived figures (medians, etc.).—Shown in this report are medians and ratios. The median, which is a type of average, is the middle value in a distribution; i.e., the median divides the distribution into two equal parts—one-half the cases fall below the median and one-half the cases exceed the median. Derived figures are not presented (but indicated by three dots "...") if there are less than 25 sample cases in the distribution or the base.

Medians for rooms and persons are rounded to the nearest tenth, for value and income to the nearest hundred dollars, and for rent to the nearest dollar. In computing medians for rooms and persons per housing unit, the whole number is used as the midpoint of the interval so that, for example, the category "4 rooms" is treated as an interval ranging from 3.5 up to 4.5 rooms. In computing median rent, units reported as "no cash rent" are excluded. The medians presented are generally computed on the basis of the distributions as shown in this report.

When the median falls in the lower terminal category of an open-end distribution, the method of presentation is to show the initial value of the next category followed by a minus sign; thus, for example, if the median falls in the category "Less than \$10,000," it is shown as "\$10,000—". When the median falls in the upper terminal category of an open-end distribution, the method of presentation is to show the initial value of the terminal category followed by a plus sign; thus, for example, if the median falls in the category "\$35,000 or more," it is shown as "\$35,000+."

Symbols.—A dash "—" signifies zero. Three dots "..." in a data column mean not applicable or that the base for a derived figure is too small for it to be shown. The symbol "NA" means not available.

Boundaries.—The data shown in this report relate to the areas as defined for the 1970 census. See appendix A for a discussion of these areas. Additional information and definitions of the 1970 boundaries are given in the 1970 Population Census PC(1)-A reports.

Other reports from the Annual Housing Survey.—In addition to the four basic reports in the Annual Housing Survey Series H-150, one or more supplementary reports (Series H-151) may be published for the United States. A series of reports (H-170) similar to H-150 will also be published for 60 selected standard metropolitan statistical areas. The data for the SMSA's are based on an independent sample of the 60 SMSA's divided into 3 groups of approximately 20 each, with 1 group interviewed every 3 years on a rotating basis. Enumeration for the first group began on April 1, 1974, and continued through March 1975. Below is a list of the SMSA's in each group:

GROUP I	GROUP II	GROUP III

*Included with Group II for the first enumeration.

QUALIFICATIONS OF THE DATA

Since the estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained from a complete census, using the same schedules, instructions, and enumerators. Particular care should be exercised, therefore, in the interpretation of figures based on relatively small numbers of sample cases as well as small differences between figures. As in any survey work, the results are subject to errors of response and nonreporting and to sampling variability. For a further discussion of accuracy of the data, see appendix B.

In making comparisons with 1970 data, differences in the data may reflect such factors as the use of direct interview for

1973 contrasted with the extensive use of self-enumeration in 1970, the sample design, the estimation procedure used, the sampling variability of the estimates, and the processing procedures. See the section on "Comparability with 1970 Census of Housing data" in appendix A for further discussion.

The concepts and definitions of most of the items in this report are essentially the same as those used for the 1970 census. The SMSA boundaries are the same as those in the 1970 census. For historical comparisons and boundary changes, refer to the census reports of 1960 and earlier.

In this report, statistics on income relate to the income of the family or primary individual. Therefore, no data are provided on household income; i.e., income of persons unrelated to the head of the household is excluded.

Statistics for some of the characteristics shown in this report are based on restricted universes and, therefore, care should be exercised in relating the statistics for one characteristic to another. For example, the characteristics shown for present and previous units occupied by recent movers are largely restricted to households with the same head in both the present and previous units. Therefore, the totals for owner-occupied units in the "same head in present and previous unit" universe do not agree with the totals for owner-occupied units for some of the other universes such as "rooms" or "persons."

See appendix A for a more detailed discussion of the definitions and qualifications of all items in this report.

DATA COLLECTION PROCEDURES

The 1973 Annual Housing Survey was conducted by enumerators who made personal visits to each sample unit and obtained the information from the occupants or, if the unit was vacant, from informed persons (landlords, rental agents, or knowledgeable neighbors) and by observation. The information reported by the numerator reflected the situation at the time of enumeration, which began in August 1973 and extended through

December 1973, with the major portion completed by the end of October.

Data were collected for sample housing units located in the counties and independent cities comprising the 461 sample areas used in current surveys of the Census Bureau. A sample of housing units was selected in these areas from the 1970 census and updated by a sample of addresses from building permits to include housing units added since 1970. Estimates of the counts and characteristics of the 1973 inventory were obtained for these sample units.

For the estimates of losses from the 1970 housing inventory, the interviewer located the address of the 1970 sample unit. If the structure which contained the 1970 sample unit no longer contained housing units (or no longer existed), the disposition of the structure was determined, i.e., lost through means such as demolition, disaster, or conversion to nonresidential use. Data on losses are shown in Part A of this series.

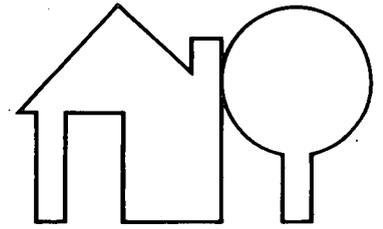

A more detailed description of the survey design and sampling procedures can be found in appendix B.

PROCESSING PROCEDURES

The questionnaires used for the 1973 Annual Housing Survey were of the conventional type, on which the enumerator recorded the information by marking a precoded check box or by writing in the entries. Census clerks edited and coded the schedules. The information from the questionnaires was data-keyed directly to magnetic tape which was processed on the Census Bureau's computers through a number of editing and tabulating steps. A facsimile of the questionnaire appears in appendix A.

The 1970 characteristics of units lost from the housing inventory were obtained by matching those units to the 1970 census records. The 1970 data for the losses were then extracted from the 1970 census record tapes. (As indicated above, data on losses are shown in Part A of this series.)

SUMMARY OF FINDINGS

INTRODUCTION

As of October 1973, approximately 13,284,000 households, or about one out of five in the United States, are recent movers, that is, households that moved into their units during the 12-month period preceding the survey date. During the 3 1/2-year period between April 1970 and October 1973, two out of five of the Nation's households moved into their present units. Since January 1960, close to 14 years ago, three-fourths of all households had changed residence, and during the 24 years since 1950, all but 11 percent of the Nation's households had moved (table A).

Significant differences occur between owners and renters in the rate of mobility. For example, during the 3 1/2-year period between April 1970 and October 1973, renters moved at more than twice the rate of owners: 63.5 percent compared with 27.8 percent. Since 1950, about 3.1 percent of the renters had not moved compared with 15.3 percent of the owners.

The predominance of renters over owners among mover households is especially apparent among the households that moved during the last year. About 8,892,000 mover households, or two-thirds of the 13,284,000 recent mover households in the United States, rent their present units while the remaining 4,392,000 own their homes. This is in contrast to the tenure pattern among all occupied housing units where owners outnumber renters by almost two to one. Recent movers who are renting their present units represent over one-third (36.0 percent) of all renter households in the Nation, while recent movers who are homeowners comprise about one-tenth (9.8 percent) of all homeowner households.

Renters are about four times more likely to have moved in the past year than owners. This is true whether they are currently residing inside the central cities of standard metropolitan statistical areas (SMSA's), in the suburbs (outside central cities of SMSA's), or outside the metropolitan areas. Among

renter households, recent movers are more prevalent in the suburbs and outside the Nation's metropolitan areas—40.7 percent and 38.5 percent, respectively—and less prevalent in central cities—31.7 percent.

For this report, the definitions and boundaries of SMSA's and central cities are the same as those used in the 1970 decennial census; changes made subsequently are not reflected. Thus, for example, some of the residences classified in this report as outside SMSA's may now be inside SMSA's according to the revised definitions of SMSA's. Similarly, some of the households shown as having moved from inside to outside a central city or to nonmetropolitan territory may have moved from one central city to another central city according to the current SMSA definition.

MOVER PATTERNS

Of the 13,284,000 recent mover households, 10,122,000 have the same head in the present as in the previous unit. The remaining 3,162,000 are households in which the present head is different from the head in the previous unit (resulting, for example, from separation, divorce, or death and newly formed households e.g., newly married couples moving into their first homes or persons leaving their former households to establish independent residences, either living alone or in partnership with others). Cross-tabulations of present by previous residence are given only where the head of the household is the same in the present and previous residence; however, one should bear in mind the impact of the households with different heads, who represent almost one-fourth (23.8 percent) of all mover households.

Of the 10,122,000 recent mover households with the same head in both the present and previous residence, approximately

SUMMARY OF FINDINGS—Continued

Table A. YEAR MOVED INTO UNIT BY TENURE: 1973

(Numbers in thousands)

Year moved into unit	Total	Inside SMSA's			Outside SMSA's
		Total	In central cities	Not in central cities	
All occupied units	69,337	47,725	22,493	25,231	21,612
April 1970 or later	28,079	19,594	9,194	10,401	8,485
Within past 12 months	13,284	9,390	4,522	4,868	3,894
1965 to March 1970	15,644	11,143	5,351	5,793	4,500
1960 to 1964	8,341	5,812	2,699	3,112	2,529
1950 to 1959	9,672	6,735	3,021	3,714	2,937
1949 or earlier	7,601	4,440	2,227	2,212	3,161

April 1970 or later	15,686	11,859	6,658	5,201	3,827
Within past 12 months	8,892	6,622	3,621	3,001	2,270
1965 to March 1970	5,309	4,162	2,758	1,404	1,147
1960 to 1964	1,782	1,399	990	409	383
1950 to 1959	1,149	858	646	212	290
1949 or earlier	758	505	353	152	253

7,000,000 or 69.2 percent reside in metropolitan areas at the time of the survey (figure 1). Of the same 10,122,000 households, 7,257,000 report their previous residence as in metropolitan areas, showing a net out-migration of 3.5 percent. This lends support to a recent development, which has been noted in other observations of recent mover patterns, of an increasing preference of movers for nonmetropolitan areas.¹ Within the metropolitan areas, the suburbs show an increase of 559,000 households or 17.8 percent, while the central cities lost 816,000 households or 19.8 percent of their previous number.

¹Population Characteristics, U.S. Bureau of the Census, Current Population Reports, Series P-20, No. 262, March 1974, and No. 273, December 1974.

Table B. ALL OCCUPIED UNITS AND UNITS OCCUPIED BY RECENT MOVERS BY METROPOLITAN AND NONMETROPOLITAN RESIDENCE, BY TENURE: 1973

(Numbers in thousands)

Tenure of present unit	All occupied units	Units occupied by recent movers	
		Number	Percent of occupied units
United States	69,337	13,284	19.2
Owner-occupied units	44,653	4,392	9.8
Renter-occupied units	24,684	8,892	36.0
Inside SMSA's	47,725	9,390	19.7
Owner-occupied units	28,942	2,767	9.6
Renter-occupied units	18,783	6,622	35.3
In central cities	22,493	4,522	20.1
Owner-occupied units	11,087	900	8.1
Renter-occupied units	11,406	3,621	31.7
Not in central cities	25,231	4,868	19.3
Owner-occupied units	17,854	1,867	10.5
Renter-occupied units	7,377	3,001	40.7
Outside SMSA's	21,612	3,894	18.0
Owner-occupied units	15,711	1,624	10.3
Renter-occupied units	5,901	2,270	38.5

Table C. PERCENT OF RECENT MOVER HOUSEHOLDS WITH SAME AND DIFFERENT HEAD: 1973

Type of household	Inside SMSA's			Outside SMSA's
	Total	In central cities	Not in central cities	
All households, 1970	69.1	33.7	35.4	30.9
All households, 1973	68.8	32.4	36.4	31.2
Recent movers, 1973	70.7	34.0	36.6	29.3
Same head	69.2	32.6	36.6	30.9
Previous residence	71.7	40.7	31.0	28.3
Different head	75.6	38.7	36.9	24.4

The shifts in metropolitan residence among recent mover households with the same head in the present and previous units should be considered, however, in conjunction with the current metropolitan-nonmetropolitan residency status of recent mover households with a different head in the previous unit (table C).

SUMMARY OF FINDINGS—Continued

A higher proportion of different-head movers, or "new" households, have current residences in metropolitan areas (75.6 percent compared to 69.2 percent for those with same head), and this fact is most evident in the central cities where 38.7 percent of the different-head movers live compared with 32.6 percent of the movers with same head. The current distribution of the different-head movers partially counterbalances the mover patterns of same-head movers and, as a result, shifts in the geographic distribution of all households between 1970 and 1973 are less pronounced.

By far the greatest number of movers with the same head in the present and previous residence are the 6,542,000 households (64.6 percent) that moved within the metropolitan areas of the country (figure 2). This includes both those households that remained in the same metropolitan areas (53.0 percent) and those that moved from one metropolitan area to another (11.7 percent). About 2,408,000 recent mover households, or 23.8 percent, remained in nonmetropolitan locations, either in the same vicinity or in another nonmetropolitan location. As indicated earlier for the remaining 1,171,000 households experiencing a change (moving from metropolitan to nonmetropolitan residence or vice versa), the pattern of move is toward the nonmetropolitan areas of the country. Approximately 714,000 households, representing 7.1 percent of the total movers with same head moved from a metropolitan location to a nonmetropolitan one. In contrast, 457,000 households or 4.5 percent of all movers moved from a nonmetropolitan to a metropolitan residence.

For many of the recent movers with the same household head, the choice of residence represents a continuation of a previous pattern (figure 3). Of the 7,257,000 households with a previous metropolitan residence, 90.2 percent are also current metropolitan residents, and 73.9 percent presently reside in the same SMSA as before the move. More than half of the movers with previous metropolitan residence—4,115,000 households or 56.7 percent—resided in central cities before moving. About the same percentage chose to remain in the central cities of the same SMSA, and 19.3 percent chose a suburban location in the same SMSA. Of those households in central cities changing from one SMSA to another, more chose the suburbs than the central cities (361,000 compared with 271,000). In fact, more households moved from a central city to a nonmetropolitan location (358,000) than elected to reside in a central city of a different SMSA. Suburban movers, also, generally selected a similar location in their own SMSA (60.3 percent). When changing SMSA's, suburbanites again chose central cities less often than the suburbs (171,000 compared with 380,000). A similar proportion of suburban movers (357,000) chose to relocate in nonmetropolitan areas.

Nonmetropolitan households, showing the same preference as their metropolitan counterparts, chose a residence similar in location to the previous one, although not by so large a proportion (84.0 percent for nonmetropolitan households compared with 90.2 percent for metropolitan households). When

moving to metropolitan areas, nonmetropolitan households more often chose the suburbs than the central cities (268,000 compared with 189,000).

REGIONS

While all four regions exhibit a somewhat similar pattern of household moves, the proportions vary. For the West, the proportion of total households comprised of recent movers is greatest at 25.7 percent. The proportions for the Northeast, North Central, and South regions are 13.9, 17.7, and 20.5 percent, respectively (table D).

The proportion of renter units occupied by recent movers is much greater than that for homeowners for every geographic area shown in this report. The largest proportion of renters who are recent movers is found in the West (45.6 percent). This is especially true in the nonmetropolitan areas of the West, where about one-half (51.5 percent) of the renter households are recent movers.

The South has the largest number of recent mover households—approximately 4,479,000—accounting for one-third of the recent movers in the country. Of these, about 62.7 percent reside inside SMSA's. The regions showing the next largest mobile population are the North Central and West, where 3,318,000 and 3,245,000 households chose to locate. Here again, the metropolitan areas account for 68.0 percent of the movers' choice in the North Central and for 78.7 percent in the West.

Table D. ALL OCCUPIED UNITS AND UNITS OCCUPIED BY RECENT MOVERS BY REGIONS, BY TENURE: 1973

(Numbers in thousands)

Region and tenure of present unit	All occupied units	Units occupied by recent movers	
		Number	Percent of occupied units
Northeast	16,152	2,242	13.9

Renter-occupied units . .	4,983	2,272	45.6

SUMMARY OF FINDINGS—Continued

CHARACTERISTICS OF RECENT MOVER HOUSEHOLDS

Recent movers show a preference for the same tenure category before and after the move. Approximately 64.8 percent of the 2,744,000 households with the same head who owned their previous homes are also currently homeowners. For the 7,379,000 renters, the comparable proportion is even higher: 72.5 percent.

For the 2,996,000 households with a tenure change, the pattern is much more likely to be from renter to homeowner (67.8 percent) than the converse. Among the 10,122,000 households with the same head in present and previous residence, the tenure rate shows a change from 72.9 percent renter and 27.1 percent owner to 62.4 percent renter and 37.6 percent owner—a significant gain for homeownership among these households. This trend is highly evident in both metropolitan and nonmetropolitan areas.

The current homeownership rate for recent movers with a different head is significantly lower (18.3 percent) than for the same head (37.6 percent). Among different-head households, 581,000 currently own their homes and 2,580,000 rent; the corresponding numbers for households with the same head are 3,810,000 and 6,312,000, respectively. Examining these statistics in a different way, approximately 29.0 percent of the renter recent movers have a different head while 13.2 percent of the owner recent movers are of this type. The proportion of renter recent movers with a different head is greater in the SMSA's (about 31 percent in both the central cities and suburbs) than in nonmetropolitan areas (23.6 percent).

About one-half (51.0 percent) of the household heads who were not heads in the previous units are under 25 years of age. Among mover households with the same head, the age group of 25 to 34 years is most prevalent (36.9 percent), followed by those with heads under 25 (20.4 percent) and those with heads 45 to 64 years old (19.0 percent). About 16.9 percent of the recent mover households with the same head are in the 35 to 44 group; the proportion among heads 65 years old and over is much smaller: 6.9 percent. Renter recent movers with the same head are younger than owner movers: The median age of renter households with the same head is 31.6 years compared with 35.4 years for owner households.

As indicated in table E, owner and renter households tend to be somewhat larger for recent movers than for all owner and renter households. The median number of persons is 3.1 for recent mover owner households and 2.2 for renters, compared with 2.8 for all household owners and 2.1 for renters. The household head of the most prevalent household type, the husband-wife family, is younger for recent movers than for all households. For owners among recent movers, the median age of the head of husband-wife families is 34.0, compared with a median of 48.0 among all homeowners. For renters, the median age is 29.2 for recent movers and 34.1 for all renter households. Single-person households, which are found slightly more often among recent movers than among all households, comprise 8.2

percent of recent mover homeowners and 27.4 percent of recent mover renters. Households headed by females account for 5.1 percent of the owners among recent movers and 15.1 percent of the renters; the corresponding proportion is greater (7.0 percent) among all owner households, but the same (15.1 percent) among all renter households.

Table E. SELECTED HOUSEHOLD CHARACTERISTICS OF ALL OCCUPIED UNITS AND UNITS OCCUPIED BY RECENT MOVERS, BY TENURE: 1973

Characteristic	All occupied units	Units occupied by recent movers
Median persons:		
Owner-occupied units	2.8	3.1
Renter-occupied units	2.1	2.2
Median age of head (husband-wife households):		
Owner-occupied units	48.0	34.0
Renter-occupied units	34.1	29.2
1-person households (percent):		
Owner-occupied units	13.9	8.2
Renter-occupied units	31.3	27.4
Female head (percent):		
Owner-occupied units	7.0	5.1
Renter-occupied units	15.1	15.1
Tenure (percent):		
Owner-occupied units	64.4	33.1
Renter-occupied units	35.6	66.9
Median income:		
Owner-occupied units	\$11,500	\$12,300
Renter-occupied units	\$7,200	\$7,300

Recent mover homeowner families and primary individuals have a higher income than all homeowner families and primary individuals; the medians are \$12,300 compared with \$11,500. The corresponding income medians for renters are not statistically different (\$7,300 for recent movers and \$7,200 for all renters). Among recent movers, as in the total population, income is higher for owners than for renters. Over a third (35.3 percent) of the recent mover homeowners are in the income class of \$15,000 or more, whereas only 13.0 percent of the renters are in this income group (figure 5). At the lower end of the income distribution, 17.0 percent of the renter recent movers have incomes of less than \$3,000 compared with 5.5 percent for owners.

SUMMARY OF FINDINGS—Continued

CHARACTERISTICS OF HOUSING OCCUPIED BY RECENT MOVERS

Housing occupied by recent movers is newer, on the average, than all occupied housing. Although 52.9 percent of all occupied housing was built since 1950, the proportion for units occupied by recent movers is higher: 62.5 percent. Units occupied by recent mover owners are of more recent construction than those occupied by renters. Approximately 40.1 percent of the units occupied by recent mover homeowners were built in April 1970 or later, compared with 16.3 percent of the renter-occupied units built during this period. On the other hand, 21.3 percent of the homeowners occupy units built before 1950, whereas 45.5 percent of the renters reside in structures of that vintage (table F).

Recent mover households are less likely than all households to live in single-family homes and more likely to live in mobile homes. About 75.7 percent of the units occupied by recent mover owners are single-family homes, compared with 87.7 percent for all owners. On the other hand, mobile homes account for 17.4 percent of the recent mover owners, compared to 6.3 percent of all owners.

The proportion of units with complete private plumbing facilities is higher for owner and renter recent mover households than for units occupied by all owner and renter households. While homeowner units with complete plumbing facilities for exclusive use account for 97.7 percent of all occupied units, the proportion of such units among recent movers is 98.6 percent. The corresponding proportions for renters are 94.2 percent among all households and 95.3 among recent mover households. The proportion of households with 1.01 or more persons per room is about the same for recent movers as for all households. For owners, the proportions are 5.1 for movers and 4.7 for all households. For renters, the proportions are 6.6 percent for movers and 7.0 percent for all households.

The median persons per household among recent movers is 3.1 for owners and 2.2 for renters; for all occupied units the median is 2.8 persons for owners and 2.1 persons for renters. Generally, housing units occupied by recent movers are smaller in number of rooms than all occupied units; renter recent movers occupy smaller units than do owners (median of 3.9 rooms compared to 5.4). Among recent mover homeowners, the 3-or-more-bedroom house is most popular, occupied by 65.2 percent of the owners. For renters, the 2-bedroom unit is the mode, occupied by 42.9 percent. The median value of units occupied by recent movers exceeds that for all homeowners: \$27,700 compared with \$24,100. Similarly, the median gross rent is higher for renter recent movers than for all renters: \$144 compared with \$133 (table F).

The value of present single-family properties occupied by homeowner recent movers with same head is considerably higher than the value of their previously occupied homeowner properties. The median value of the present units is \$34,400, a gain of 34.4 percent over the \$25,600 median value of the units

Table F. SELECTED HOUSING UNIT CHARACTERISTICS OF ALL OCCUPIED UNITS AND UNITS OCCUPIED BY RECENT MOVERS, BY TENURE: 1973

Characteristic	All occupied units	Units occupied by recent movers
Year structure built (percent of occupied):		
Owner-occupied units:		
Before 1950	42.3	21.3
April 1970 or later	10.5	40.0
Renter-occupied units:		
Before 1950	55.8	45.5
April 1970 or later	9.8	16.3
Units in structure (percent):		
Owner-occupied units:		
1	87.7	75.7
2 to 4	4.8	4.3
5 or more	1.2	2.6
Mobile home or trailer	6.3	17.4
Renter-occupied units:		
1	34.1	32.8

Renter-occupied units	4.0	3.9
Value	\$24,100	\$27,700
Gross rent	\$133	\$144

previously owned by these recent movers. Approximately 4.0 percent of current homeowners occupy properties valued at less than \$10,000 and 48.5 percent occupy those valued at \$35,000 or more. This is in contrast to the distribution for the previous units, which shows an occupancy of 8.0 percent for those of less than \$10,000 and 26.3 percent for units valued at \$35,000 or more. Each value class shows a substantial proportion moving to a higher class (table G).

SUMMARY OF FINDINGS—Continued

Table G. PERCENT CHANGE IN VALUE OF PRESENT AND PREVIOUS UNITS OF RECENT MOVERS WITH SAME HEAD: 1973

Value: Previous unit	Value: Present unit, specified owner occupied			
	Total	In lower class interval	In same class interval	In higher class interval
Specified owner-occupied units . .	100.0	9.2	36.5	54.3
Less than \$10,000 . . .	100.0	—	34.2	65.8
\$10,000 to \$14,999 . .	100.0	6.0	13.1	81.0
\$15,000 to \$19,999 . .	100.0	3.9	10.5	85.6
\$20,000 to \$24,999 . .	100.0	6.8	13.0	80.1

\$35,000 or more	100.0	16.9	83.1	—

Table H. PERCENT CHANGE IN GROSS RENT OF PRESENT AND PREVIOUS UNITS OF RECENT MOVERS WITH SAME HEAD: 1973

Gross rent: Previous unit	Gross rent: Present unit, specified renter occupied			
	Total	In lower class interval	In same class interval	In higher class interval
Specified renter-occupied units . .	100.0	34.3	31.6	34.1
Less than \$50	100.0	—	39.5	60.5
\$50 to \$69	100.0	8.6	21.0	70.4
\$70 to \$79	100.0	20.7	7.7	71.6
\$80 to \$99	100.0	21.7	19.5	58.8
\$100 to \$119	100.0	24.9	18.6	56.4
\$120 to \$149	100.0	29.0	23.7	47.3
\$150 to \$199	100.0	33.9	45.4	20.7
\$200 or more	100.0	61.4	38.6	—

Renters, in contrast to homeowners, pay about the same rent for their housing after moving. The median gross rent for renter households with the same head is \$149 for the previous unit and \$147 for the present unit. About 1,503,000 renter households, or 34.1 percent of those moving from rented units who continue to rent their housing, pay more rent where they now live. Approximately the same proportion (34.3 percent) pay less rent in their present unit than in their previous unit; 31.6 percent stayed in the same gross rent intervals (table H). More than half of all the households formerly renting units for less than \$120 are now paying a higher rent. For example, of the 169,000 households in the \$70 to \$79 class, 71.6 percent are now

located in a higher class; about one-fourth (24.9 percent) of these households now occupy units in the next higher class, \$80 to \$99. The largest absolute number of renters is in the \$150 to \$199 group; of these 1,174,000 households, 20.7 percent (which is not statistically different than the 24.9 percent above) now occupy units in the next higher class, \$200 or more (table H). On the other hand, households in the upper rent classes often move to somewhat less expensive units. About a third (33.9 percent) of those previously paying between \$150 and \$199 now pay less. For the highest rent classification (\$200 or more), 61.4 percent now occupy units in lower rent classes.

Although the amounts for both value and rent are given in current rather than in constant dollars, and thus are subject to some inflationary influence, a comparison between previous and present residences is considered feasible because the time interval involved is confined to a 12-month period.

REASON FOR MOVE

Changes in family status and housing needs, factors that are interrelated and often interchangeable, account for about 65.0 percent of the reasons given by recent movers for moving (table I). Unpublished tabulations indicate that a number of reasons included in the change in family status category reflect the personal or social character of housing statistics, such as marriage, divorce, or the expansion of a family to accommodate elderly parents or other relatives. For areas outside SMSA's, job-related reasons occupy a greater proportion of the total than for any other location. This fact may reflect, in part, the lack of adequate transportation systems in these areas, often forcing households to move when job locations change. In contrast, the proportion of households in the central cities moving for this reason is the smallest of any location, attributable, in part, not only to greater job availability, but to the presence of more adequate transportation systems.

Table I. REASON FOR MOVE: 1973

Reason for move	Total	Inside SMSA's			Outside SMSA's
		Total	In central cities	Not in central cities	
Units occupied by recent movers	100.0	100.0	100.0	100.0	100.0
Job related	23.3	21.5	20.0	22.9	27.6
Family status	33.1	34.5	34.1	34.7	30.0
Housing needs	31.7	32.4	33.9	31.0	30.2
Other	9.4	9.2	9.3	9.1	9.8
Not reported	2.5	2.5	2.7	2.3	2.5

SUMMARY OF FINDINGS—Continued

HOUSEHOLDS WITH HEADS OF NEGRO RACE

Almost 18.9 percent (1,315,000 households) of the 6,962,000 Negro households in the United States were recent movers in 1973—about the same percentage as for recent mover households with heads of white and other races (18.8 percent, figure 6). Among Negro recent movers, renters substantially outnumber owners, 1,018,000 compared with 298,000, and represent a fourth of the 3,938,000 renter-occupied units with Negro household head (table J).

Although the proportion of Negro homeowners who are recent movers is approximately the same as that of homeowners with heads of white and other races, it is less than the proportion of homeowners with heads of Spanish origin who are recent movers. Among Negro renters, however, the proportion represented by recent movers is much smaller than the other two groups: 25.9 percent compared with 39.1 percent of renters in Spanish-origin households and a similar proportion, 38.0 percent, of renters in households of white and other races.

The highest proportion of all recent movers is in the West and so is the highest proportion of Negro recent movers (27.9 percent). The proportions of Negro recent movers for the other regions are: Northeast, 17.8 percent; North Central, 19.9 percent; and South, 17.2 percent.

For both owners and renters, the most prevalent household type is that containing two or more persons: 91.9 percent of Negro movers who are homeowners and 74.3 percent of those who are renters. The proportion of Negro owner and renter households with two or more persons headed by females is much larger than for the rest of the Nation's households, representing 22.6 percent of the Negro mover owners and 44.6 percent of the Negro mover renters; the corresponding figures for households of white and other races are 4.3 percent and 17.7 percent. By income, Negro movers exhibit a pattern similar to all recent movers. Income among recent mover owners exceeds that for total Negro owner-occupied units (median of \$9,600 compared with \$8,000), while that for recent movers among renters is similar to that for total Negro renters (\$5,500). However, for both Negro owner and renter movers, income is well below that for the other households in the Nation.

The largest age group for Negro mover households is headed by an individual between the ages of 25 to 34 years, representing 37.2 percent of those households with the same head. As with all movers, those with a different head are younger, with 47.0 percent under 25 years old.

The proportions of Negro mover owners and renters in single-unit structures are 77.9 percent and 30.4 percent, respectively. The proportions among white and other races are about the same: 75.5 and 33.2 percent. Homeowner units built since 1970 represent 8.2 percent of all owner-occupied Negro housing units, but about one-third of recent mover homes. Housing built before 1950 accounts for 54.9 percent of all owner-occupied units, but about one-third of recent mover units. Renter-occupied housing constructed April 1970 or later amounts to

5.3 percent of all Negro renter housing, but 10.4 percent of recent mover renter housing, while the comparable figures for housing built before 1950 are 64.9 percent of all Negro renter housing and 55.7 percent of recent mover housing.

Units with complete plumbing facilities account for 91.9 percent of Negro recent movers compared to 89.5 percent for all Negro units. Among recent movers of white and other races, the proportion is higher: 96.9 percent. In regard to units with 1.01 or more persons per room, there is no statistical difference between Negro recent mover units and all Negro units. Recent mover units also report higher values and rents than do all occupied units, with a median value of \$20,100 compared with \$15,700, and a median gross rent of \$122 compared with \$107.

HOUSEHOLDS WITH HEADS OF SPANISH ORIGIN

Although those households whose head is of Spanish origin represent only 4.0 percent of all households in the United States, their representation among recent movers is 5.8 percent. Of these 776,000 households, comprising 28.2 percent of all Spanish-origin households (figure 6), renters substantially outnumber owners: 612,000 compared with 164,000 (see also table K). The largest proportion of Spanish recent movers is found in the West (44.5 percent).

SUMMARY OF FINDINGS—Continued

About 93.9 percent of the homeowners among the Spanish movers are two-or-more-person households; for renters, the comparable proportion is 85.1 percent. Median income is about the same among Spanish owners for movers as for all Spanish households: \$10,200 compared with \$9,800; among renters the medians are also similar, \$6,300 for movers compared with \$6,500. Median income for movers is higher for Spanish renters than for Negro renters but is about the same for owners.

The single-unit structure is the most common among Spanish mover homeowners, being selected by 82.9 percent of the

households; for renters the comparable proportion is 32.7 percent. As with all other recent movers, housing occupied by Spanish households is newer than that for all occupied units, and housing of owners is newer than that of renters. Approximately 33.5 percent of the owner units occupied by Spanish recent movers was built in April 1970 or later compared with 11.4 percent for renter recent mover units. Median property value for Spanish recent mover units is about the same as for all Spanish units: \$22,200 and \$19,800, respectively. The median gross rent is also about the same: \$135 for Spanish movers and \$127 for all Spanish households.

on the basis of the results of the 1970 census. Changes in SMSA definition criteria, boundaries, and titles made after February 1971 are not reflected in this series of reports. SMSA's are defined by the Office of Management and Budget (formerly Bureau of the Budget).

Except in the New England States, a standard metropolitan statistical area is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county or counties containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are socially and economically integrated with the central city. In the New England States, SMSA's consist of towns and cities instead of counties. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. For a detailed description of the criteria used in defining SMSA's, see the Bureau of the Budget publication cited above.

In this report, figures for "in central cities" refer to all housing units within the legal city boundaries. For a few central cities, the figures include some housing units in parts of the city classified as rural in the 1970 census.

DEFINITIONS AND EXPLANATIONS OF SUBJECT CHARACTERISTICS

General

As stated in the introductory text of this report, the 1973 Annual Housing Survey was conducted by direct interview. The survey enumerators were instructed to read the questions directly from the questionnaire. The definitions and explanations given below for each subject are to a considerable extent drawn from various technical and procedural materials used in the collection of the data. This material helped the enumerative personnel to understand more fully the

intent of each question and thus to resolve problem or unusual cases. Additional explanatory information has been added to this portion of the text to assist the user in the proper utilization of the statistics.

Comparability with 1970 Census of Housing data.—The concepts and definitions used in the 1970 census are generally comparable for items that appear in both the 1970 census and the 1973 survey. The major difference, however, is the time period classifying "recent movers." In the Annual Housing Survey, recent movers are households that moved into their unit during the 12 months prior to enumeration, a time period of 1 year or less. In the 1970 Census of Housing reports, different time periods were used. In Volume II, **Metropolitan Housing Characteristics**, the shortest time period for "year moved into unit," is "1969 to March 1970" (1½ years); in Volume IV, **Components of Inventory Change**, the period is 1969 to December 1970 (approximately 2 years); and in Volume VII, No. 5, **Mover Households**, the time period is April 1965 to March 1970 (approximately 5 years). Volume IV is the only 1970 census report which shows cross-tabulations of data on characteristics of present units by characteristics of previous units for recent movers. Other definitional differences, if any, are discussed under the particular subject later in this section.

Additional differences between the 1973 Annual Housing Survey data and the 1970 census data may be attributed to several factors. These include the extensive use of self-enumeration in the census in contrast to direct interview in the Annual Housing Survey; differences in processing procedures; the estimation procedures and sample designs; the sampling variability of the estimates from the Annual Housing Survey; to a smaller extent, the sampling variability associated with the sample data from the census; the nonsampling errors associated with the Annual Housing Survey estimates; and the nonsampling errors associated with the census estimates.

Comparability with Current Population Survey.—The Current Population Survey (CPS) is a monthly sample survey of approximately 58,000 designated sample units. From the data collected in the Current Population Survey, the Census Bureau issues several publications under the general title Current Population Reports. Included are reports on household and family characteristics, mobility of the population, and income.

The concepts and definitions used in this report are essentially the same as those used in the Current Population Reports. However, there is a major difference in the concept of "mover." In this report, household heads that moved into their units during the 12 months prior to enumeration are classified as "recent movers." In the Current Population Reports, individuals whose current place of residence is different than in March 1970 are classified as "movers."

There are also likely to be significant differences between the income data shown in this report and the income data shown in the Current Population Reports. The time period covering income is different in that in this report income covers the 12 months prior to the date of enumeration while the income data in the Current Population Reports refer to the calendar year prior to the date of enumeration. There are also significant differences in the way income questions are asked. Additional differences between the 1973 Annual Housing Survey and the Current Population Survey may be attributed to factors such as the sampling variability and nonsampling errors of the figures from the two surveys, survey procedures and techniques, and processing procedures.

Living Quarters

Living quarters are classified as either housing units or group quarters. Usually, living quarters are in structures intended for residential use (e.g., a one-family home, apartment house, hotel or motel, boarding house, or mobile home or trailer). Living quarters may also be in structures intended for nonresidential use

(e.g., the rooms in a warehouse where a watchman lives), as well as in places such as tents, caves, and old railroad cars.

Housing units.—A housing unit is a house, an apartment, a group of rooms, or a single room occupied or intended for occupancy as separate living quarters. Separate living quarters are those in which the occupants do not live and eat with any other persons in the structure and which have either (1) direct access from the outside of the building or through a common hall which is used by the occupants of another unit or by the general public or (2) complete kitchen facilities for the exclusive use of the occupants. The occupants may be a single family, one person living alone, two or more families living together, or any other group of related or unrelated persons who share living arrangements (except as described in the section on group quarters). For vacant units, the criteria of separateness, direct access, and complete kitchen facilities for exclusive use are applied to the intended occupants whenever possible. If the information cannot be obtained, the criteria are applied to the previous occupants. Both occupied and vacant housing units are included in the housing inventory, except that mobile homes, trailers, tents, caves, boats, railroad cars, and the like, are included only if they are occupied.

Group quarters.—Group quarters are living arrangements for institutional inmates or for other groups containing five or more persons not related to the person in charge. Group quarters are located most frequently in institutions, boarding houses, military barracks, college dormitories, fraternity and sorority houses, hospitals, monasteries, convents, and ships. A house or apartment is considered group quarters if it is shared by the person in charge and five or more persons unrelated to him, or if there is no person in charge, by six or more unrelated persons. Information on the housing characteristics of group quarters was not collected.

APPENDIX A—Continued

Rules for mobile homes, hotels, rooming houses, etc.—Mobile homes or trailers, tents, boats, or railroad cars are not considered housing units if vacant, used only for business, or used only for vacations.

Occupied rooms or suites of rooms in hotels, motels, and similar places are classified as housing units only when occupied by permanent residents; i.e., persons who consider the hotel as their usual place of residence or have no usual place of residence elsewhere. Vacant rooms or suites of rooms are classified as housing units only in those hotels, motels, and similar places in which 75 percent or more of the accommodations are occupied by permanent residents.

If any of the occupants in a rooming house live and eat separately from everyone else in the building and have either direct access or complete kitchen facilities for exclusive use, their quarters are classified as separate housing units. The remaining quarters are combined. If the combined quarters contain four or fewer roomers unrelated to the head, they are classified as one housing unit; if the combined quarters contain five or more roomers unrelated to the head or person in charge, they are classified as group quarters. In a dormitory, residence hall, or similar place, living quarters of the supervisory staff and other employees are separate housing units if they satisfy the housing unit criteria; other living quarters are considered group quarters.

Institutions.—Living quarters of staff personnel are separate housing units if they satisfy the housing unit criteria. Other living quarters are considered group quarters.

Occupancy Characteristics

Occupied housing units.—A housing unit is classified as occupied if a person or group of persons is living in it at the time of enumeration or if the occupants are only temporarily absent—for example, on vacation. However, if the unit was occupied entirely by persons with a usual place of residence elsewhere, the unit is

classified as vacant. By definition, the count of occupied housing units is the same as the count of households.

Race.—The classification by race shown here refers to the race of the head of the household occupying the housing unit. The concept of race as used by the Census Bureau does not denote clear-cut scientific definitions of biological stock. The classification of race in the 1973 Annual Housing Survey was made by the enumerator based on his own observation. In the 1970 census, race was essentially a self-classification by people according to the race with which they identified themselves. Detailed characteristics of units with Negro head of household are presented in separate tables.

Spanish origin.—The classification by Spanish origin here refers to the origin of the head of the household occupying the housing unit. Detailed characteristics of units with head of Spanish origin are presented in separate tables. Spanish origin was determined on the basis of a question that asked for self-identification of a person's origin or descent. Respondents were asked to select their origins from a "flash card." Persons of Spanish origin were those who indicated that their origin was either Mexican-American, Chicano, Mexican, Mexicano, Puerto Rican, Cuban, Central or South American, or other Spanish.

In the 1970 census and current surveys' reports, Spanish persons are identified according to various criteria: Birthplace, birthplace of parents, language, surname, and origin or descent. For this reason, care should be taken in making comparisons of Spanish origin estimates from the Annual Housing Survey and other surveys.

Tenure.—A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," including units rented

for cash rent and those occupied without payment of cash rent.

Year moved into unit.—Data on year moved into unit are based on the information reported for the head of the household. The question refers to the year of latest move. Thus, if the head moved back into a unit he had previously occupied, the year of his latest move was to be reported; if he moved from one apartment to another in the same building, the year he moved into his present unit was to be reported. The intent is to establish the year the present occupancy by the head began. The year the head moves is not necessarily the same year other members of the household move, although in the great majority of cases the entire household moves at the same time.

Units Occupied by Recent Movers

Recent movers.—Households that moved into their present units within 12 months prior to the date of enumeration are termed "recent movers." The household is classified by year moved into unit on the basis of information reported for the head of the household.

Present and previous units of recent movers.—The "present" unit is the unit occupied by the recent mover at the time of enumeration. The previous unit is the unit from which he moved. If the household moved more than once during the 12 months prior to the date of enumeration, the previous unit is the one from which the household last moved.

Same or different head.—Characteristics of the present and previous units occupied by recent movers are largely restricted to households that were essentially the same in the two units. The definitions of the characteristics for the previous unit are generally the same as those for the present unit.

A household for which the head in the present unit is the same person as the head in the previous unit (identified in the tables as "same head") is considered

APPENDIX A—Continued

essentially the same even though there may have been some changes in the composition of the household. Conversely, a household in which there was no change except for a new household head was considered a household with "different head."

Main reason for move into present unit.—

The statistics presented are restricted to units occupied by recent movers in which the present head of household was also the head at the previous unit he occupied. The classification categories refer to the principal reason the head of the household moved into his present unit. The category "job related reasons" refers to reasons such as job transfer, new job, retirement, and commuting reasons. The category "family status" refers to reasons such as newly married, family increased in size, and moved to be closer to relatives. The category "housing needs" refers to reasons such as wanted to own his own residence, wanted a less expensive house, and didn't like his old neighborhood. The category "other reasons" includes reasons for moving which do not fall into any of the above classifications.

Utilization and Structural Characteristics

Persons.—All persons occupying the housing unit are counted. These persons include not only occupants related to the head of the household but also any lodgers, roomers, boarders, partners, wards, foster children, and resident employees who share the living quarters of the household head. The data on "persons" show the number of housing units occupied by the specified number of persons.

A person is enumerated at his usual place of residence. This refers to the place where the person lives and sleeps most of the time. This place is not necessarily the same as his legal residence, voting residence, or domicile.

Rooms.—The statistics on "rooms" are in terms of the number of housing units with specified number of rooms. Rooms counted include whole rooms used for living purposes such as living rooms,

dining rooms, bedrooms, kitchens, finished attic or basement rooms, recreation rooms, permanently enclosed porches that are suitable for year-round use, and lodgers' rooms. Also included are rooms used for offices by a person living in the unit.

A partially divided room, such as a dinette next to a kitchen or living room, is a separate room only if there is a partition from floor to ceiling, but not if the partition consists only of shelves or cabinets.

Not included in the count of rooms are bathrooms, halls, foyers or vestibules, balconies, closets, alcoves, pantries, strip or pullman kitchens, laundry or furnace rooms, unfinished attics or basements, other unfinished space used for storage, open porches, trailers used only as bedrooms, and offices used only by persons not living in the unit.

If a room is used by occupants of more than one unit, the room is included with the unit from which it is most easily reached.

Persons per room.—"Persons per room" is computed for each occupied unit by dividing the number of persons in the unit by the number of rooms in the unit. The figures shown refer, therefore, to the number of housing units having the specified ratio of persons per room.

Bedrooms.—The number of bedrooms in the unit is the count of rooms used mainly for sleeping, even if also used for other purposes. Rooms reserved for sleeping such as guest rooms, even though used infrequently, are counted as bedrooms. On the other hand, rooms used mainly for other purposes, even though used also for sleeping, such as a living room with a hideaway bed, are not considered bedrooms. A housing unit consisting of only one room, such as one-room efficiency apartment, is classified, by definition, as having no bedroom.

Basement.—Statistics on basements are presented in terms of the number of housing units located in structures built with a basement. A structure has a base-

ment if there is enclosed space in which persons can walk upright under all or part of the building.

Year structure built.—Year structure built refers to when the building was first constructed, not when it was remodeled, added to, or converted. The figures relate to the number of units in structures built during the specified periods and in existence at the time of enumeration. For mobile homes and trailers, the model year was assumed to be the year built.

Units in structure.—In the determination of the number of units in a structure, all housing units, both occupied and vacant, were counted. The statistics are presented in terms of the number of housing units in structures of specified type and size, not in terms of the number of residential structures. A structure is a separate building that either has open space on all sides or is separated from other structures by dividing walls that extend from ground to roof.

When one or more rooms have been added to a mobile home or trailer it is classified as a one-family house. If, however, only a porch or shed has been added, it is still counted as a mobile home or trailer. In tables 1, 10, and 19, mobile homes and trailers are shown as a separate category; in tables 3, 12, and 21, they are included in the "1 unit" category.

Parking facilities.—The statistics on parking facilities presented in this report are restricted to renter-occupied units for which cash rent is paid and exclude one-family homes on 10 acres or more. The data refer to off-street parking facilities which are available in connection with the building. The facilities are provided by the landlord or management and must be available without an additional cost to the renter. The parking facility may be a garage, carport, driveway, or open lot where the occupant may park his car off the street.

Plumbing Characteristics and Equipment

Plumbing facilities.—The category "with all plumbing facilities" consists of units

APPENDIX A—Continued

which have hot and cold piped water inside the structure as well as a flush toilet and a bathtub or shower inside the structure for the exclusive use of the occupants of the unit. All plumbing facilities must be located in the structure but they need not be in the same room. "Lacking some or all plumbing facilities" means that the unit does not have all three specified plumbing facilities (hot and cold piped water, as well as flush toilet and bathtub or shower inside the structure), or that the toilet or bathing facilities are also for the use of the occupants of other housing units.

Complete bathrooms.—In this report, counts are shown only for occupied housing units which have more than one complete bathroom, i.e., one complete bathroom plus half bath as well as those with two bathrooms or more. A housing unit is classified as having a complete bathroom if it has a room with a flush toilet and bathtub or shower and a wash basin, as well as piped hot water in the structure for the exclusive use of the occupants of the unit. A half bathroom has either a flush toilet or a bathtub or shower for exclusive use, but does not have all the facilities for a complete bathroom.

Sewage disposal.—In this report, counts are shown only for occupied housing units with a public sewer. A public sewer is connected to a city, county, sanitary district, neighborhood, or subdivision sewer system. It may be operated by a governmental body or private organization. Small sewage treatment plants which in some localities are called neighborhood septic tanks are classified as public sewers. Not included in the category "with public sewer" are septic tanks, cesspools, chemical toilets, privies, and other means of sewage disposal.

Air conditioning.—Air conditioning is defined as the cooling of air by a refrigeration unit; excluded are evaporative coolers, fans, or blowers which are not connected to a refrigeration unit. A room unit is an individual air conditioner which

is installed in a window or an outside wall and is generally intended to cool one room, although it may sometimes be used to cool more than one room. A central system is a central installation which air conditions the entire housing unit. In an apartment building, a central system may cool all apartments in the building, each apartment may have its own central system, or there may be several systems, each providing central air conditioning for a group of apartments. A central installation with individual room controls is a central air-conditioning system.

Automobiles and trucks available.—Statistics on automobiles available represent the number of passenger automobiles, including station wagons, which are owned or regularly used by any member of the household and which are ordinarily kept at home. The figures include leased automobiles and company-owned automobiles kept at home. Police cars, taxicabs, pickups, or larger trucks were not to be counted.

The data on trucks available represent the number of pickups and small panel trucks of one-ton capacity or less which are owned or regularly used by any member of the household and which are ordinarily kept at home. Trucks used for business purposes were included only if also used for personal activities of household members.

The statistics do not reflect the number of privately owned automobiles or trucks or the number of households owning such vehicles.

Garbage and trash collection service.—The statistics on garbage and trash collection service presented in this report are restricted to renter-occupied units for which cash rent is paid and exclude one-family homes on 10 acres or more. The data refer to whether or not the cost of garbage and trash collection service is paid by the renter. The service may be public or private. If the garbage (food waste) is collected by one company and the trash (paper, cans, etc.) by another, the data refer to the garbage collection service.

Financial Characteristics

Value.—Value is the respondent's estimate of how much the property (house and lot) would sell for if it were for sale. The statistics on value are shown only for one-family homes on less than 10 acres without a commercial establishment or medical or dental office on the property. Owner-occupied cooperatives, condominiums, mobile homes, and trailers are excluded from the value tabulations.

Median value is shown separately for housing units with garage or carport on property. The garage or carport must be currently available for use by the occupants of the unit; i.e., the members of the household can use it for parking even if it is currently used as a storage area for items such as lawn equipment or furniture. It may be attached to the house or it may be completely unattached, but it must be on the property. Excluded are garages or carports that have been converted to other uses such as living quarters, an extra room for business purposes, rented to someone else, or for some reason cannot be used for parking.

Gross rent.—The computed rent termed "gross rent" is the contract rent plus the estimated average monthly cost of utilities (electricity, gas, water) and fuels (oil, coal, kerosene, wood, etc.), if these items are paid for by the renter (or paid for him by someone else, such as a relative, welfare agency, or friend) in addition to rent. Contract rent is the monthly rent agreed to, or contracted for, regardless of any furnishings, utilities, or services that may be included. Thus, gross rent is intended to eliminate differentials which result from varying practices with respect to the inclusion of utilities and fuel as part of the rental payment. The estimated costs of water and fuels are reported on a yearly basis but they are converted to monthly figures in the computation process.

The statistics on rent exclude one-family houses on 10 acres or more. Renter units occupied without payment of cash rent are shown separately as "no cash rent" in the rent tabulations.

APPENDIX A—Continued

Mortgage on property.—Statistics are presented on the number of owner-occupied housing units with a mortgage or similar debt and whether the mortgage or similar debt is insured. The data are restricted to one-family homes on less than 10 acres without a commercial establishment or medical or dental office on the property. "Mortgage or similar debt" refers to all forms of debt where the property is pledged as security for repayment of the debt by the head of household or other household members. Included are such debt instruments as mortgages, deeds of trust, mortgage bonds, vendors' liens, and contracts to purchase. Units with no mortgage or similar debt outstanding on the property comprise the category "owned free and clear."

A mortgage or similar debt is considered insured if it is currently insured by the Federal Government, i.e., insured by the Federal Housing Administration (FHA), guaranteed by the Veterans Administration (VA), or insured by the Farmers' Home Administration. Excluded are mortgages or similar debts insured or guaranteed by private mortgage insurance companies, State or local government agencies, or other similar organizations.

Public or subsidized housing.—A housing unit is classified as being in a "public housing project" if the structure in which the unit is located is owned by a local housing authority or other public agency, such as a housing and redevelopment authority or a housing development agency, and operated as public housing. These organizations may receive subsidies from the Federal or State government but the local agency owns the property. All other housing units are classified as "private housing."

Private housing units are further classified by whether the unit is subsidized; that is, the respondent pays a lower rent because a Federal, State, or local government program pays part of the cost of construction, building mortgage, or operating expenses. These programs include (1) the interest subsidy programs of the Department of Housing and Urban Development (HUD) for rental and cooperative

housing for moderate-income families, (2) the rent supplement program where part of the rent for low-income families occupying certain types of rental housing projects is paid by HUD, and (3) the direct loan program of HUD for housing the elderly.

The statistics on public or subsidized housing exclude one-family homes on 10 acres or more and renter units occupied without payment of cash rent. In addition, the data are not based on government or local records; the figures are, therefore, subject to the ability of a respondent to properly classify his unit as public or private and, if private, as subsidized or nonsubsidized housing.

Household Characteristics

Household.—A household consists of all the persons who occupy a housing unit. By definition, the count of households is the same as the count of occupied housing units.

Head of household.—One person in each household is designated as the "head," that is, the person who is regarded as the head by the members of the household. However, if a married woman living with her husband is reported as the head, her husband was considered the head for the purpose of simplifying the tabulations.

Household composition.—Statistics by age of head are presented separately for two-or-more-person households and for one-person households. Households having two or more persons are further subdivided as follows:

Male head, wife present, no nonrelatives.—Each household in this group consists of the head and his wife, and other persons, if any, all of whom are related to him.

Other male head.—This category includes households with male head, wife present, with nonrelatives living with them; male heads who are married, but with wife absent because of separation or other reason where hus-

band and wife maintain separate residences; and male heads who are widowed, divorced, or single.

Female head.—This group comprises households with female heads regardless of their marital status. Included are female heads with no spouse and female heads whose husbands are living away from their families, for example, husbands in the Armed Forces living on military installations.

Households consisting of only one person are shown separately as "one-person households" and are not included in the subcategories "other male head" and "female head."

Family or primary individual.—Housing units are occupied by either "families" or "primary individuals." The term "family" refers to the head of a household and all (one or more) other persons living in the same household who are related to the head by blood, marriage, or adoption. If the head lives alone or with nonrelatives only, then the head is considered a "primary individual."

Married couples related to the head of a family are included in the family and are not considered as separate families. A lodger, servant, or other person unrelated to the head is considered a member of the household but not of the family.

In the statistics on household composition, families are always included in one of the three major groups of two-or-more-person households. Primary individuals with nonrelatives living with them are tabulated as "other male head" or "female head." Primary individuals living alone are always tabulated as "one-person households."

Subfamily.—A subfamily is a married couple with or without children, or one parent with one or more own single (never married) children under 18 years old, living in a household and related to, but not including the head of the household or his wife. The most common example of a subfamily is a young married couple sharing the home of the husband's or wife's parents.

APPENDIX A—Continued

Age of head.—The age classification refers to the age reported for the head of the household as of his last birthday.

Persons 65 years old and over.—All persons, including the head, who are members of the household and are 65 years and over are included in the count of persons 65 years old and over.

Own children.—Statistics on presence of "own" children of household heads are shown in this report. A child under 18 years old is defined as an "own" child if he or she is a single (never married) son, daughter, stepchild, or adopted child of a household head. Own children of sub-families are excluded from the total count of own children.

Nonrelative.—A nonrelative of the head is any person in the household who is not related to the head by blood, marriage, or adoption. Roomers, boarders, lodgers, partners, resident employees, wards, and foster children are included in this category.

Income.—The statistics on income in the Annual Housing Survey are based on the respondent's reply to questions on income for the 12 months prior to enumeration and is the sum of the amounts reported for wage and salary income, net self-employment income, Social Security or railroad retirement income, public assistance or welfare payments, and all other money income. The figures represent the amount of income received before deductions for personal income taxes, Social Security, union dues, bond purchases, health insurance premiums, Medicare deductions, etc.

In this report, the statistics relate to the money income of the family or primary individual occupying the housing unit, that is, the sum of the income of the head of the family and all other members

of the family 14 years old and over or the income of the primary individual. Incomes of persons living in the unit but not related to the head of the household are not included in this sum.

Wage or salary income is defined as the total money earnings received for work performed as an employee at any time during the 12 month period prior to enumeration. It includes wages, salary, piece rate payments, commissions, tips, cash bonuses, and Armed Forces pay. Net self-employment income is defined as net money income (gross receipts minus operating expenses) received from a business, professional practice, partnership, or farm in which the person was engaged on his own account.

Social Security or railroad retirement income includes cash receipts of Social Security pensions; survivors' benefits; disability insurance programs for retired persons, dependents of deceased insured workers, or disabled workers; and deductions for Medicare and health insurance premiums. Cash receipt of retirement, disability, and survivors' benefit payments made by the U.S. Government under the Railroad Retirement Act are also included. Separate payments received for hospital or other medical care are not included.

Income from all other sources includes money income received from sources such as periodic payments from estates and trust funds; dividends; interest; net rental income (or loss) from property rentals; net receipts from roomers or boarders; net royalties; public assistance or welfare payments which include cash receipts received from public assistance programs such as old age assistance, aid to families with dependent children, and aid to the blind or totally disabled; unemployment insurance benefits; money received for transportation and/or subsistence by persons participating in special governmental training programs such as the Area Redevelopment Act and the

Manpower Development and Training Act; workmen's compensation cash benefits; periodic payments by the Veterans Administration to disabled members of the Armed Forces or to survivors of deceased veterans; public or private pensions; periodic receipts from insurance policies or annuities; alimony or child support from persons who are not members of the household; net gambling gains; and nonservice scholarships and fellowships.

Receipts from the following sources were not included as income: Value of income "in kind" such as free living quarters, housing subsidies, food stamps, or food produced and consumed in the home; money received from the sale of property (unless the recipient was engaged in the business of selling such property); money borrowed; tax refund; withdrawal of bank deposits; accrued interest on "uncashed" savings bonds; exchange of money between relatives living in the same household; and gifts and lump-sum insurance payments, inheritances, and other types of lump-sum receipts.

The income statistics and the characteristics of the household refer to different periods in time; the income data refer to the 12 months prior to enumeration whereas the household characteristics refer to the date of enumeration. Thus, the income of the family does not include amounts received by persons who were members of the family during all or part of the income period if these persons no longer resided with the family at the time of enumeration. On the other hand, family income includes amounts reported by related persons who did not reside with the family during the income period but who were members of the family at the time of enumeration. For most families, however, the income reported was received by persons who were members of the family throughout the income period.

SAMPLE DESIGN

The estimates are based on data collected in August through December 1973 for the Annual Housing Survey (AHS), which was conducted by the Bureau of the Census, acting as collection agent for the Department of Housing and Urban Development. The sample for this survey was spread over 461 sample areas (called primary sampling units), comprising 923 counties and independent cities with coverage in each of the 50 States and the District of Columbia.

Approximately 53,800 sample housing units (both occupied and vacant) were eligible for interview in the 1973 AHS. Of this number, 1,500 interviews were not obtained because, for occupied housing units, the occupants were not found at home after repeated calls or were unavailable for some other reason, or, for vacant housing units, no informed respondent could be found after repeated visits. In addition to the 53,800, there were also 5,500 sample units which were visited but found not to provide information relevant to the 1973 housing inventory.

Selection of sample areas.—The United States was divided into areas made up of

counties and independent cities referred to as primary sampling units (PSU's). Then the PSU's were grouped into 376 strata, 156 of which consisted of only one PSU, which was in sample with certainty. These strata were mostly the larger SMSA's and were called self-representing (SR) since the sample from the sample area represented just that PSU. Each one of the other 220 strata consisted of a group of PSU's and were referred to as non-self-representing (NSR), since the sample from the sample PSU in a stratum represented the other PSU's in the stratum as well.

One PSU was selected from each NSR stratum with probability proportionate to the 1970 census population of the PSU. (This resulted in 220 NSR sample PSU's.) In addition, the NSR strata were grouped into 110 pairs, and one stratum was picked at random from each pair. From this stratum, an additional PSU was selected independent of the other PSU selected from this stratum. Since the two PSU's were independently selected, it was possible for the same PSU to be selected twice. This occurred in 25 instances, producing an additional 85 NSR sample PSU's.

Selection of sample housing units.—The overall sampling rate used in the 1973 AHS was about 1 in 1,366. The within-PSU sampling rate for AHS was determined so that the overall probability of selection for each sample housing unit was the same (e.g., if the probability of selecting a NSR PSU was 1 in 10, then the within-PSU sampling rate would be 1 in 13.66).

Within the sample PSU's, a sample of the housing units enumerated in the 1970 Census of Population and Housing was selected for AHS. In addition, a sample of new construction building permits was also selected to represent the units constructed since the 1970 census. These samples were selected at about twice the rate mentioned previously (i.e., at 2 in

1,366), thereby producing a sample twice as large as needed. This sample was split into two equal-sized samples—one to be used for AHS and one to be held in reserve for possible future use for AHS. The procedure used to split this sample into half-samples is described in the next section.

The sample of 1970 census units was selected in several stages of sampling. The first step was the selection of a sample of census enumeration districts (ED's), administrative units used in the 1970 census. The probability of selection for an ED was proportionate to its 1970 population. The next step was to select a cluster of about four neighboring housing units within each sample ED. For most of the ED's, the selection was accomplished using the list of addresses for the ED as compiled in the 1970 census. However, in those ED's where addresses were incomplete or inadequate (mostly rural areas), the selection process was accomplished using area sampling methods. These ED's were subdivided into segments, i.e., small land areas with well-defined boundaries having an expected size of about four housing units.

The sample of new construction units was selected from building permits issued since the time of the 1970 census. Within each sample PSU, the building permits were chronologically ordered by month issued, and clusters of housing units with an expected size of four were created. These clusters were then sampled for inclusion in AHS at the sampling rate of 2 in 1,366. As a result of the area sampling methods mentioned above, housing units constructed since the 1970 census in areas which do not issue building permits were brought into the sample.

Splitting of the sample.—The sample selection procedure as described above produced segments of size-four housing units for the sample taken from the census address frame, the new construction frame, and the area sampling frame

APPENDIX B—Continued

(mainly rural areas). One can expect a minimum loss in precision for segments of size-four housing units in rural areas because of the heterogeneity of this type of housing unit. Segments of size two, however, were considered to be more optimal for sampling within those areas where one could expect neighboring units to be very similar (e.g., urban areas and new construction units). It is felt that if one were to go to segments of size-four housing units in this type of area, a significant loss in precision would result. A splitting operation was then carried out for segments selected from the census address and new construction frames. This consisted of halving each segment of four housing units that was selected for the sample. Two housing units from each segment were to be included in the survey and two were to be held in reserve. No splitting operation was carried out within the segments selected from the area sampling frame; every other area sample segment of four housing units was used for the survey and the remaining segments were assigned to the reserve sample.

ESTIMATION

The 1973 AHS estimates employed a three-stage ratio estimation procedure. However, prior to implementation of the procedure, the basic weight (i.e., the inverse of the probability of selection) was adjusted to account for the noninterview housing units encountered in AHS. This noninterview adjustment was done separately for occupied and vacant units. The noninterview adjustment was equal to the following ratio:

$$\frac{\text{Interviewed housing units} + \text{noninterviewed housing units}}{\text{Interviewed housing units}}$$

The first-stage ratio estimation procedure was employed for sample housing units from non-self-representing (NSR) PSU's only. This procedure was designed to reduce the contribution to the variance arising from the sampling of PSU's. The first-stage ratio estimation procedure takes into account the differences that existed at the time of the 1970 census in

the distribution by tenure and residence of the housing population estimated from the sample NSR PSU's and that of the NSR housing population in each of the four census regions of the country.

The first-stage ratio estimate factor for each specified category was as follows:

$$\frac{\text{The 1970 census housing population in the residence-tenure category for all NSR strata in a census region}}{\text{Estimate of the housing population category using 1970 census housing counts for sample NSR PSU's in a census region}}$$

The numerators of the ratios were calculated by obtaining the 1970 census housing counts for each of the residence-tenure categories for each NSR stratum and summing these counts across the NSR strata in each census region. The denominators were calculated by obtaining the 1970 census housing counts for each of the residence-tenure categories for each NSR sample PSU, weighting these counts by the inverse of the probability of selecting that PSU, and summing these weighted counts across the NSR PSU's in each census region.

The computed first-stage ratio estimate factor was then applied to the existing weight for each NSR sample unit in each first-stage ratio estimation category.

The second-stage ratio estimation procedure was only employed for AHS new construction sample units (i.e., sample units built April 1, 1970, or later). This procedure was designed to adjust the AHS sample estimates of new construction units to independently derived current estimates for three categories of new construction units (i.e., two categories for conventional new construction units and one for new construction mobile homes). These independent estimates were considered to be the best estimates available for current estimates of new construction units. This adjustment was necessary so as to correct for known deficiencies in the AHS sample with regard to representation of new construction units.

The second-stage ratio estimate factor for each specified category was as follows:

$$\frac{\text{Current independent estimate of new construction units in the category}}{\text{AHS sample estimate of new construction units in the category}}$$

The numerators of the ratios were derived from data based on the Survey of Construction (SOC), a survey of building permits conducted monthly by the Bureau of the Census.

The denominators of the ratios were obtained from the weighted estimates for the AHS sample units, using the existing weight after the first-stage ratio estimation procedure (i.e., the estimates employing the noninterview and first-stage adjustments).

The computed second-stage ratio estimate factor was then applied to the existing weight for each sample unit in each second-stage ratio estimation category.

The third-stage ratio estimation procedure was employed for all AHS sample units. This procedure was designed to adjust the AHS sample estimates of housing (i.e., the estimates employing the noninterview, first-stage, and second-stage adjustments) to independently derived current housing estimates for four types of vacant housing units and for residence-tenure-race of head-sex of head categories for occupied housing units.

The third-stage ratio estimate factor for each specified category was as follows:

$$\frac{\text{Current independent estimate of housing units in the category}}{\text{AHS sample estimate of housing units in the category}}$$

The numerators of the ratios for occupied housing units were derived from data based on the Current Population Survey (CPS), a household survey conducted monthly by the Bureau of the Census. The numerators of the ratios for vacant housing units were derived from data based on the Housing Vacancy Survey (HVS), a quarterly vacancy survey conducted by the Bureau of the Census.

The denominators of the ratios were obtained from the weighted estimates for the AHS sample units, using the existing weight after the second-stage ratio estimation procedure.

The computed third-stage ratio estimate factor was then applied to the existing weight for each sample unit in each third-stage ratio estimation category.

The second- and third-stage ratio estimation procedures were repeated in an iterative process in order to bring the AHS estimates into close agreement with both sets of independent estimates (i.e., the independent estimates employed for the second-stage ratio estimation process as well as those employed for the third-stage ratio estimation process). The factors resulting from this iterative process were then applied to the existing weight on the appropriate records, and the resulting product was used as the final weight for tabulation.

The effect of the third-stage ratio estimation procedure, as well as the overall estimation procedure, was to reduce the sampling error for most statistics below what would have been obtained by simply weighting the results of the sample by the inverse of the probability of selection. The distribution of the housing population selected for the sample differed somewhat, by chance, from that of the nation as a whole in such basic housing characteristics as tenure, vacancy status, residence, race of head, and sex of head. These characteristics are probably closely correlated with other housing characteristics measured for AHS. Therefore, through the use of the three-stage ratio estimation procedure, one can expect the sample estimate to be improved substantially when the sample housing population is brought into close agreement with a known distribution of the entire housing population with respect to these basic housing characteristics.

RELIABILITY OF THE ESTIMATES

There are two types of possible errors associated with estimates based on data from sample surveys: Sampling and nonsampling errors. The "accuracy" of a survey estimate is determined by the joint effects of the sampling and nonsampling errors. Following is a description of the sampling and nonsampling errors associated with the AHS-National sample.

Sampling errors.—The particular sample used for this survey is one of a large number of possible samples of the same size that could have been selected using the same sample design. Even if the same schedules, instructions, and enumerators were used, estimates from each of the different samples would differ from each other. The deviation of a sample estimate from the average of all possible samples is defined as the sampling error. The standard error of a survey estimate attempts to measure this variation among the estimates from the possible samples and thus is a measure of the precision with which an estimate from a sample approximates the average result of all possible samples.

As calculated for this report, the standard error also partially measures the variation in the estimates due to response and enumerator errors (nonsampling errors), but it does not measure, as such, any systematic biases in the data. Therefore, the accuracy of the estimates depends on both the sampling and nonsampling errors measured by the standard error and biases and some additional nonsampling errors not measured by the standard error.

The sample estimate and its estimated standard error enable one to construct interval estimates such that the interval includes the average result of all possible samples with a known probability. For example, the average result would be included in the interval from one standard error below and above the sample estimate for about 68 out of 100 possible samples. For about 90 out of 100 possible samples, the interval from 1.6 standard errors below and above the sample estimate would include the average result; and for about 95 out of 100 possible samples, the interval from two standard errors below and above the sample estimate would include the average result.

All statements of comparison appearing in this report are significant at the 1.6 standard error level or higher, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated difference is greater than twice the

standard error of the difference. Statements of comparison qualified in some way (e.g., by the use of the phrase, "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

The figures presented in the tables below are approximations to the standard errors of various estimates shown in this report. In order to derive standard errors that would be applicable to a wide variety of items and also could be prepared at a moderate cost, a number of approximations were required. As a result, the tables of standard errors provide an indication of the order of magnitude of the standard errors rather than the precise standard error for any specific item.

Tables I and II present the standard errors applicable to housing unit estimates in this report. Table I shows the approximate standard errors applicable to all housing unit estimates in this report except those pertaining to selected items in the tables. The standard errors shown in table II should be used for those selected items. Linear interpolation should be used to determine standard errors for estimates not specifically shown in tables I and II.

TABLE I. Standard Errors of Estimated Number of Housing Units: 1973 (Excludes estimates of housing units pertaining to Mortgage on Property, Parking Facilities, Garbage and Trash Collection Service, Public or Subsidized Housing, Basement, Public Sewer, Households With Negro Head, or Households With Head of Spanish Origin)

(68 chances out of 100)

Size of estimate (000)	Standard error (000)	Size of estimate (000)	Standard error (000)
25	5	2,500	50
50	7	5,000	70
100	10	10,000	96
250	16	25,000	134
500	23	50,000	138
1,000	32		

APPENDIX B—Continued

TABLE II. Standard Errors of Estimated Number of Housing Units Pertaining to Mortgage on Property, Parking Facilities, Garbage and Trash Collection Service, Public or Subsidized Housing, Basement, Public Sewer, Households With Negro Head, or Households With Head of Spanish Origin: 1973

(68 chances out of 100)

Size of estimate (000)	Standard error (000)	Size of estimate (000)	Standard error (000)
25	6	1,000	40
50	9	2,500	63
100	13	5,000	87
250	20	10,000	119
500	28	25,000	165

The reliability of an estimated percentage depends upon the size of the percentage and the size of the total upon which the percentage is based. An approximation to the standard error of a percentage may be obtained by using the following formula:

- Let x = the numerator
- y = the denominator
- σ_x = the standard error of the numerator
- σ_y = the standard error of the denominator

The standard error of the percentage (i.e., (100) (x/y)) is approximately equal to

$$(100) (x/y) \sqrt{\left(\frac{\sigma_x}{x}\right)^2 - \left(\frac{\sigma_y}{y}\right)^2}$$

The standard errors of x and y should be obtained from the appropriate standard error tables. For ratios, where x is not a subclass of y, the above formula underestimates the standard error of the ratio when there is little or no correlation between x and y. For this type of ratio, a better approximation of the standard error may be obtained by changing the sign in the formula from minus (-) to plus (+).

Illustration of the use of the standard error tables.—Table A-1 of this report shows that in the United States there were 4,392,000 owner-occupied housing units occupied by recent movers in 1973. Interpolation in table I above shows that the standard error of an estimate of this size is approximately 65,000. Consequently, the 68-percent confidence interval, as shown by these data, is from 4,327,000 to 4,457,000 housing units. Therefore, a conclusion that the average estimate of 1973 owner-occupied housing units occupied by recent movers lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. Similarly, we could conclude that the average estimate of 1973 owner-occupied housing units occupied by recent movers, derived from all possible samples, lies within the interval from 4,288,000 to 4,496,000 housing units with 90 percent confidence; and that the average estimate lies within the interval from 4,262,000 to 4,522,000 housing units with 95 percent confidence.

Table A-1 also shows that of the 4,392,000 owner-occupied housing units occupied by recent movers, 394,000 or 9.0 percent had six persons or more. Table I above shows that the standard error for 394,000 is approximately 20,000. Therefore, using the formula for the standard error of a percentage (as shown in the paragraph following table II above), the standard error of the 9.0 percent is approximately .4 percentage points:

$$.4 = (100) \left(\frac{394,000}{4,392,000}\right) \sqrt{\left(\frac{20,000}{394,000}\right)^2 - \left(\frac{65,000}{4,392,000}\right)^2}$$

Consequently, the 68-percent confidence interval, as shown by these data, is from 8.6 to 9.4 percent; the 90-percent confidence interval is from 8.4 to 9.6 percent; and the 95-percent confidence interval is from 8.2 to 9.8 percent.

Differences.—The standard errors shown are not directly applicable to differences between two sample estimates. The standard error of a difference between estimates is approximately equal to the square root of the sum of the squares of

the standard errors of each estimate considered separately. This formula is quite accurate for the difference between estimates of the same characteristic in two different areas or the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error.

Illustration of the computation of the standard error of a difference.—Table A-1 of this report also shows that in the United States there were 501,000 owner-occupied housing units occupied by recent movers with five persons in 1973. Thus, the apparent difference between the number of owner-occupied housing units occupied by recent movers with five persons and the number with six persons or more is 107,000. The standard error of 394,000 is 20,000 as is shown above. Table I shows that the standard error on an estimate of 501,000 is approximately 23,000. Therefore, the standard error of the estimated difference of 107,000 is about

$$30,000 = \sqrt{(20,000)^2 + (23,000)^2}$$

Consequently, the 68-percent confidence interval for the 107,000 difference is from 77,000 to 137,000 housing units. Therefore, a conclusion that the average estimate of the difference, derived from all possible samples, lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. Similarly, the 95-percent confidence interval is from 47,000 to 167,000 housing units, and thus we can conclude with 95 percent confidence that the number of 1973 owner-occupied housing units occupied by recent movers with five persons is greater than the number with six or more persons in the United States.

Medians.—For the medians presented in certain tables, the sampling error depends on the size of the base and on the distribution upon which the median is based. An approximate method for measuring the reliability of the estimated median is

to determine an interval about the estimated median such that there is a stated degree of confidence that the average median from all possible samples lies within the interval. The following procedure may be used to estimate confidence limits of a median based on sample data:

1. From tables I and II in conjunction with the formula for the standard error of a percentage, determine the standard error of a 50-percent characteristic on the base of the median;
2. Add to and subtract from 50 percent the standard error determined in step 1; and
3. Using the distribution of the characteristic, read off the confidence interval corresponding to the two points established in step 2.

For about 68 out of 100 possible samples, the average median from all possible samples would lie between these two values.

A two-standard-error confidence interval may be determined by finding the values corresponding to 50 percent plus and minus twice the standard error determined in step 1. For about 95 out of 100 possible samples, the average median from all possible samples would lie between these two values.

Illustration of the computation of the standard error of a median.—Table A-1 of this report shows that the median number of persons in owner-occupied housing units occupied by recent movers in the United States was 3.1 in 1973. The base of the distribution, from which this median was determined, is 4,392,000 housing units.

1. Table I in conjunction with the formula for the standard error of a percentage shows that the standard error of 50 percent on a base of 4,392,000 is .7 percentage points:

$$.7 = (100) \left(\frac{2,196,000}{4,392,000} \right) \sqrt{\left(\frac{46,000}{2,196,000} \right)^2 - \left(\frac{65,000}{4,392,000} \right)^2}$$

2. To obtain a two-standard-error confidence interval on the estimated

median, add to and subtract from 50 percent twice the standard error determined in step 1. This yields percentage limits of 48.6 to 51.4.

3. From table A-1, it can be seen by cumulating the frequencies for the first two categories that 1,597,000 owner-occupied housing units occupied by recent movers, or 36.4 percent, had up to two persons (actually, the category of two persons is considered to be from 1.5 to 2.5 persons) and that an additional 977,000 housing units, or 22.2 percent, had three persons (i.e., 2.5 to 3.5 persons). By linear interpolation, the lower limit of the 95-percent confidence interval is found to be about

$$2.5 + (3.5 - 2.5) \left(\frac{48.6 - 36.4}{22.2} \right) = 3.05$$

Similarly, the upper limit of the 95-percent confidence interval is found to be about

$$2.5 + (3.5 - 2.5) \left(\frac{51.4 - 36.4}{22.2} \right) = 3.18$$

Thus, the 95-percent confidence interval ranges from 3.05 to 3.18 persons.

Nonsampling errors.—In general, nonsampling errors can be attributed to many sources: inability to obtain information about all cases, definitional difficulties, differences in the interpretation of questions, inability or unwillingness to provide correct information on the part of respondents, mistakes in recording or coding the data, and other errors of collection, response, processing, coverage, and estimation for missing data. As can be seen from the above list, nonsampling errors are not unique to sample surveys since they can, and do, occur in complete censuses as well.

Obtaining a measurement of the total nonsampling error associated with the estimates from a survey is very difficult, considering the number of possible sources of error.

However, for the 1973 AHS-National sample, a study was conducted to obtain a measurement of the nonsampling error associated with the AHS estimates. A

reinterview program was conducted for a sample of the AHS households. These households were revisited and answers to some of the questions on the AHS questionnaire were obtained again. The original interview and the reinterview were assumed to be two independent readings and thus were the basis for the measurement of the accuracy of the AHS estimates.

As part of the reinterview, a check was made at each of these households to determine if the following were done during the original interview:

1. The correct unit was visited.
2. The correct number of housing units was interviewed at that address.
3. The correct information on "Year Built" was obtained.
4. The correct information on "Tenure" was obtained.
5. The correct information on "Household Composition" was obtained.
6. The correct information on "Type of Housing Unit" was obtained.
7. The correct information on "Occupancy Status" was obtained.

This check was for interviewer evaluation and control; i.e., tolerance limits were derived to determine which interviewer passed or failed this reinterview with regard to the above items.

The results of the reinterview study are presented in the following internal memorandum: **Reinterview Results for the Annual Housing Survey-National Sample: 1973.** Some of these results are:

1. "Overall, the results showed a fairly consistent response between the original interview and the reinterview."
2. "For most of the basic survey items or categories within them, the measure of inconsistent response was in the 20-50 range, which is moderate and indicates there is some problem with inconsistent reporting." (The range is from 0-100 with a high index being associated with a high level of response variability.)

The results of this study were based on sample data, so there is sampling error

associated with the estimates of nonsampling error. The possibility of such errors should be taken into account when considering the results.

With respect to errors of coverage and estimation for missing data, the AHS new construction sample had deficiencies with regard to the representation of both conventional new construction in permit-issuing areas and new construction mobile homes (see section on estimation). During the sampling of building permits, only those issued January 1, 1970, or later were eligible to be sampled to represent conventional new construction in permit-issuing areas. It had been assumed that units with permits issued prior to 1970

would have been completed by the time of the 1970 census (i.e., April, 1970) and therefore would have been represented in the sample selected from 1970 census units. This assumption, however, has been found to be invalid since there was an estimated 600,000 units with permits issued before 1970 but which were completed after the 1970 census. Therefore, these conventional new construction units had no representation in the AHS sample of conventional new construction. Secondly, unlike the procedure for conventional new construction, there is no sampling procedure connected with the representation of new construction mobile homes. New mobile homes in area

segments, however, do come into the AHS sample. In addition, new mobile homes in address segments also come into sample if the mobile homes are located in mobile home parks identified as such in the 1970 census. However, new mobile homes in address segments that are located in mobile home parks, not in existence at the time of the 1970 census or not identified as such in the 1970 census, have no chance of coming into the AHS sample. It has been estimated that the AHS sample misses about one-half of all new mobile homes (i.e., about 700,000 units). The second-stage ratio estimation procedure was employed to correct both these deficiencies.
